NOTE: Generators can be a great tool during a power outage, but they can also pose serious safety hazards to you and to others, so please follow all safety instructions provided by the manufacturer. For safety's sake, be sure to install and use your generator correctly so that it cannot "back feed," or flow into utility power lines. Failure to do so could damage your property, and endanger your life and the lives of line workers who may be working on power lines some distance from your home.
